```

First we create a dataset of the information to analyse in PowerBI. Here we use 2 csv files to define our 2 tables to be imported into Excel these being a players table and a matches table, these screenshots show a subset of these two tables.

snookermatches.csv

File Origin: 1252: Western European (Windows) | Delimiter: Comma | Data Type Detection: Based on first 200 rows

MatchID	Tournament	Season	Date	Player1	Player2	Winner	FramesWonP1	FramesWonP2	Ct
1	World League	2023/2024	02/10/2023	Edwards	Sebastian	Edwards	5	3

Extract Table Using Examples | Load | Transform Data | Cancel

Next, in PowerBI we load in both the players.csv and the snookermatches.csv as our initial two tables to work with.

MatchPlayers

Power Query Editor interface showing the 'Unpivot Columns' operation. The ribbon includes 'Data Type: Text', 'Replace Values', 'Unpivot Columns', 'Detect Data Type', 'Fill', 'Move', 'Merge Columns', 'Rename', 'Pivot Column', 'Convert to List', 'Split Column', 'Format', 'Extract', and 'Parse'.

The formula bar shows: `= Table.RemoveColumns(...)`

The data table is as follows:

MatchID	Player1	Player2
1	Edwards	Sebastian
2	Johnson-Smith-Peters	Edwardo
3	Samuels	Neeman
4	Kylie	Carvalho
5	Edwards	Newton
6	Kylie	Willison

A tooltip for 'Unpivot Columns' states: "Translate all but the currently unselected columns into attribute-value pairs."

Power Query Editor interface showing the 'Unpivot Columns' operation. The ribbon includes 'File', 'Home', 'Transform', 'Add Column', 'View', 'Tools', and 'Help'. The 'Transform' ribbon shows 'Unpivot Columns' selected.

The formula bar shows: `= Table.RenameColumns(#"Unpivoted Columns",{{"Attribute", "Role"}, {"Value", "PlayerName"}})`

The data table is as follows:

MatchID	Role	PlayerName
1	Player1	Edwards
2	Player2	Sebastian
3	RoundOrder	1
4	Player1	Johnson-Smith-Peters
5	Player2	Edwardo
6	RoundOrder	1
7	Player1	Samuels
8	Player2	Neeman
9	RoundOrder	1
10	Player1	Kylie
11	Player2	Carvalho
12	RoundOrder	1
13	Player1	Edwards
14	Player2	Newton
15	RoundOrder	2
16	Player1	Kylie

Here we in the power query editor we create a reference table from our Matches table and name this MatchPlayers. We then remove all columns from this table except MatchID, Player1 and Player2. Further to this we then select both Player1 and Player2 columns and unpivot these columns to

create separate rows in our MatchPlayers table for each player contesting in a match.

	123 MatchID	A ^B _C Role	A ^B _C PlayerName
1		1 Player1	Edwards
2		1 Player2	Sebastian
3		2 Player1	Johnson-Smith-Peters
4		2 Player2	Edwardo
5		3 Player1	Samuels
6		3 Player2	Neeman
7		4 Player1	Kylie
8		4 Player2	Carvalho
9		5 Player1	Edwards
0		5 Player2	Newton
1		6 Player1	Kylie
2		6 Player2	Willison
3		7 Player1	Johnson-Smith-Peters
4		7 Player2	Sebastian
5		8 Player1	Kylie
6		8 Player2	Edwardo
7		9 Player1	Mitchem
8		9 Player2	Walters
9		10 Player1	Doe
0		10 Player2	Ferguson
1		11 Player1	Stevensons-Hu
2		11 Player2	Richardson

Both columns are then renamed from Attribute And Value to **Role** and **PlayerName**.

Select tables and columns that are related.

From table
Players

Age	Country	PlayerID	PlayerName	Ranking
31	England	1	Edwards	4
19	Germany	2	Kimberson	2
24	China	3	Longen	5

To table
MatchPlayers

MatchID	PlayerName	Role
1	Edwards	Player1
1	Sebastian	Player2
2	Johnson-Smit...	Player1

Cardinality
One to many (1:*)

Single

☒ Make this relationship active
☐ Apply security filter in both directions
☐ Assume referential integrity

Save **Cancel**

In the model view we define our relationships by right clicking a table such as Players. This will bring the following above screen where we define our relationship from the from Table to the to Table and we select the column that is the link between the 2 tables in this case it is PlayerName. We define a One To Many Relationship because a Player can have many MatchPlayer records but a MatchPlayer links to only one Player Record. We also define a One To Many Relationship between Matches And MatchPlayers with the column link this time being MatchID.

← **New relationship** ×

Select tables and columns that are related.

From table
Matches

CenturyBreaks	Date	FramesWonP1	FramesWonP2	HighestBreak	MatchDuration	MatchID
2	02 October 2...	5	3	118	142	1
1	03 October 2...	4	5	102	151	2
3	04 October 2...	5	1	126	119	3

To table
MatchPlayers

MatchID	PlayerName	Role
1	Edwards	Player1
1	Sebastian	Player2
2	Johnson-Smit...	Player1

Cardinality
One to many (1:*)

☒ Make this relationship active
☐ Apply security filter in both directions
☐ Assume referential integrity

Save **Cancel**

☐ From: table (column) ↑	Relationship	To: table (column)	Status	
☐ MatchPlayers (MatchID)	* — 1	Matches (MatchID)	Active	...
☐ MatchPlayers (PlayerName)	* — 1	Players (PlayerName)	Active	...

Now we are ready to start creating reports.

Visualizations

Month
Day

Y-axis

Count of MatchID

The first report created shows the total number of matches across the years as a line graph. To generate this we choose the date column from our matches table to represent x-axis and the count of match ids from our matches table.

Y-axis

Tournament

X-axis

Count of MatchID

Add data fields here

Small multiples

Add data fields here

The second report created shows the number of matches across the tournaments as a clustered bar chart. To generate this for the x-axis the Matches Tournament column is chosen and for the y-axis this is a count of the Matches Match Id's for each Tournament.

Matches Played and Matches Won by PlayerName

Calculations

```

1 Matches Played =
2 DISTINCTCOUNT(MatchPlayers[MatchID])

1 Matches Won =
2 CALCULATE(
3     COUNTROWS(Matches),
4     Matches[Winner] = SELECTEDVALUE(Players[PlayerName])
5 )
    
```

Y-axis

PlayerName

X-axis

Matches Played

Matches Won

The third report shows matches played and matches won by player name. DAX measures are created for creating the Matches Player and Matches Won statistics.

For Matches Played we use DISTINCTCOUNT to distinctly count all match ids in the matchplayers table.

For Matches Won we use CALCULATE to count all rows in the Matches table and use the Matches Winner column filtering out a certain players matches where they have won.

All Reports With Example Screenshots

Tournament	Round of 32	Round of 16	Quarter Final	Semi Final	Final	Total
World League	145.00	135.33	176.00			145.25
